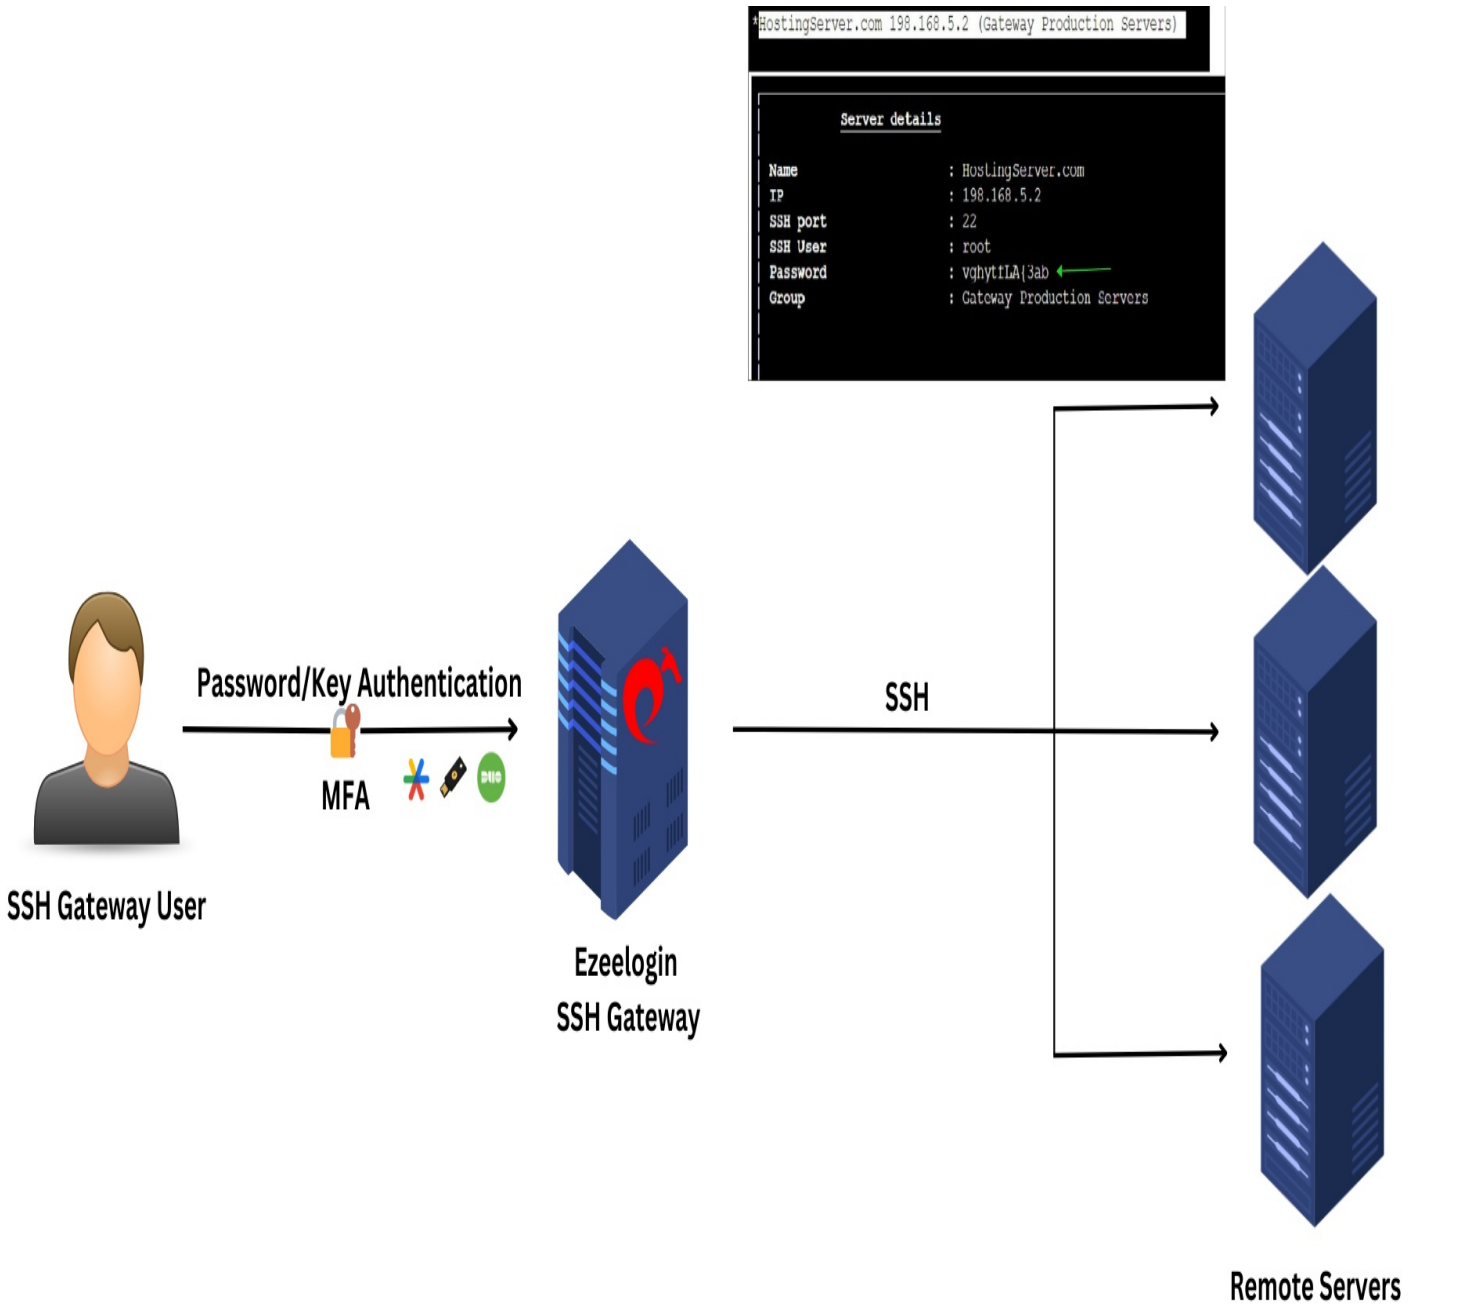
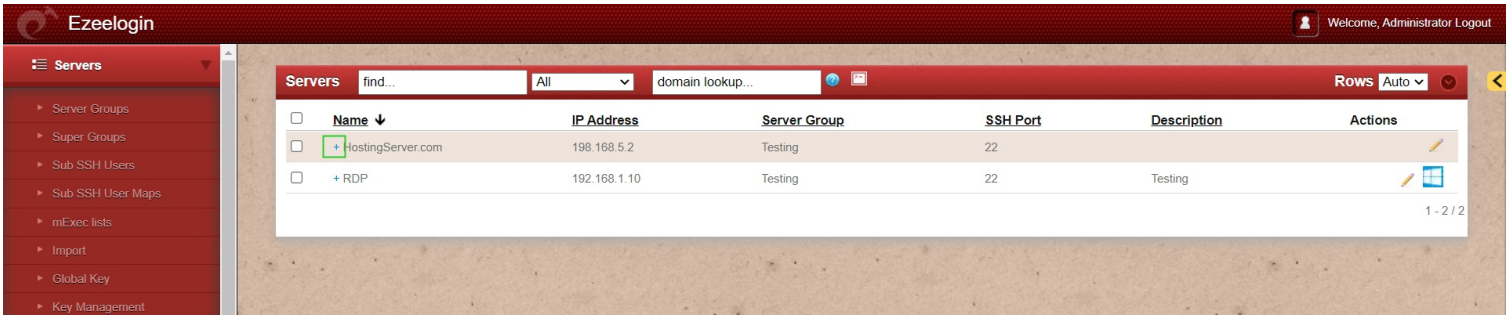
How to view the remote server password from the Jumpserver?

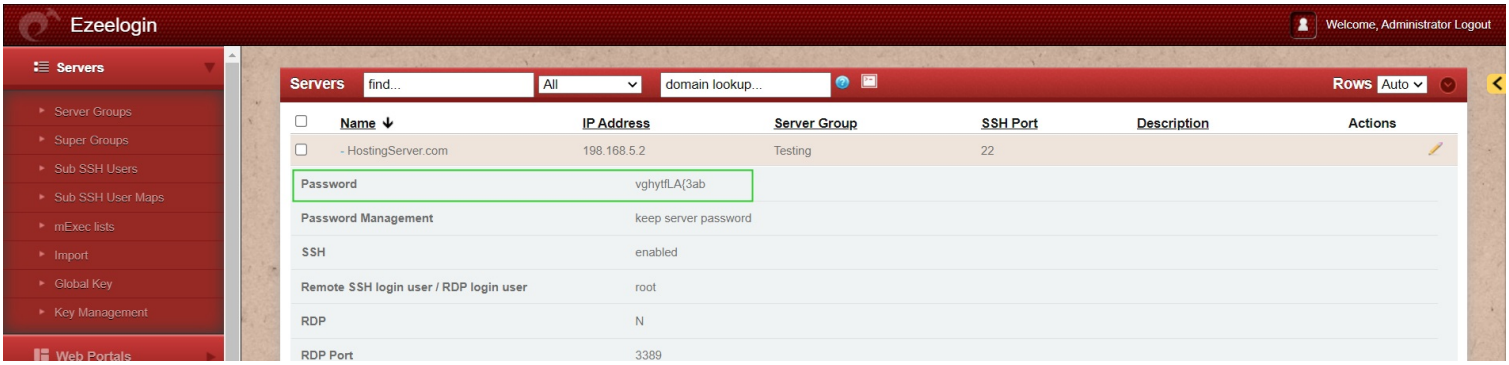
Overview: This article describes how a gateway user can view the remote server password from the gateway server, web SSH console, or terminal.



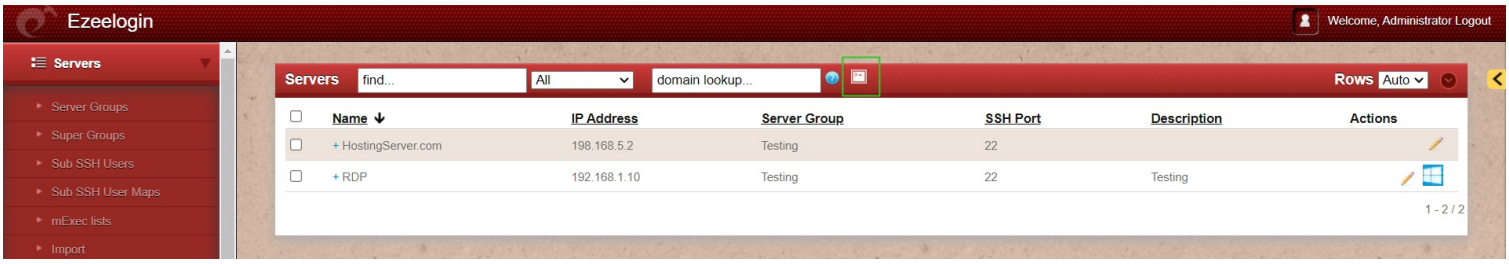
How to add a server

Step 1: To view the password of the remote server from the gateway server, first add the server, then click on the '**+**' icon in the web GUI to view the remote server password.





Step 2: To view the remote server password from the web Ezsh (Ezeelogin Shell / Backend / Terminal), either click on the web SSH console in the web GUI or log in to ezsh from any terminal (e.g., ssh ezadmin@192.168.5.2).



Select the server from the list of server groups that have been added. Then, click the '**Tab**' button to view the details with password of the selected server.

Step 3: To view the password after logging into the remote server from the gateway panel, enter the internal command **"ezinfo"** after logging into any remote server from the gateway machine.

To view the remote server password in the GUI you need to enable 2FA and access the GUI via HTTPS.
