What agents need to be installed on the remote server?

Overview: This article explains whether there is a need to install any agents on the remote servers that need to be managed using Ezeelogin.

No, there are **no agents** that need to be installed on the remote server or cloud instances that need to be managed. The only requirement is that you need to have **SSHD packages** installed and the **SSHD daemon** running on the remote server/instance which is usually available by default with almost every Linux distribution.
