Grant parallel shell privilege for a gateway user

Overview: This article explains on how to grant parallel shell access to a gateway user.

Parallel shell is disabled by default for all users except for the admin user created during installation and must be explicitly granted.

> Make sure to log in as the super admin user or any other admin privileged user to grant permission to access the parallel shell.

Step 1: Login as an admin privileged user, navigate to **Access Control** -> **User -Action** -> **Servers** -> **Allow Parallel Shell,** and enable it.

Step 2: After enabling the parallel shell, re-login to Ezeelogin backend(ezsh) so that the new settings are loaded.

> Every command will work in the parallel shell except the interactive commands like file editor (vi, nano), top, etc.
