

Default outbound ssh port for target servers added in

174 admin October 6, 2024 [Tweaks & Configuration](#) 5831

How to set default SSH port for target servers?

Overview: This article helps admin privileged users to set up default SSH port for added target servers so that the SSH port is auto-filled in server add forms. This is helpful when you set a non-standard SSH port commonly for all your servers.

Step 1: To setup default SSH port navigate to **Settings -> General -> Defaults -> Defaults SSH Port.**

For example, if you are using a custom SSH port **32002** for your fleet of servers, then change the **Default SSH Port** variable to 32002 so that this SSH port is auto-filled in server add forms.

The image contains two screenshots from the Ezeelogin web interface. The top screenshot shows the 'General Settings' page, specifically the 'Defaults' tab. The 'Default SSH Port' is set to 32002. A green box highlights the 'Defaults' tab in the top navigation bar, and a green arrow points from the 'Default SSH User' field to the 'Default SSH Port' field. The bottom screenshot shows the 'Add Server' form. The 'SSH Port' field is pre-filled with 32002, which is highlighted by a green box. A green arrow points from the 'SSH Port' field in the 'Add Server' form to the 'Default SSH Port' field in the 'General Settings' page above it.
