Enhancing execution speed in parallel shell

Overview: This article explains how to enhance parallel shell execution speed by adjusting the mExec Concurrency variable.

To increase the speed of parallel shell execution, increase the mExec Concurrency variable. The number of processes created for parallel shell execution would be equal to the value assigned in this variable.

Note: The load on the ssh gateway server would be directly proportional to this variable during execution. Ensure, that you enough server resources on the server if the value needs to be set high.
