

Migrating Ezeelogin database manually when the table size is large for faster Ezeelogin software upgrades

399 Manu Chacko December 22, 2023 [Installation](#) 2246

The Ezeelogin database table will have to be manually migrated when the row count of the database tables `_gwactivity_logs`, `_serveractivity_logs`, `bprefix_webactivity_logs`, `_sshlogs` exceeds 500,000 entries. The reason for such large row counts in the DB tables would be because of a large number of Ezeelogin gateway users accessing the remote servers.

Below, we have outlined the steps on how to check the table count in the database before performing the upgrade.

Run the following command to find out the count for log tables in the Ezeelogin gateway server. Enter the MySQL root password when it prompted

For example:

If the counts of the tables are greater than 500,000 tuples, then take a database dump, table dump, and then truncate the table in the db before performing the upgrade.

1. Backup ezeelogin database. Run the following command to take the backup of the Ezeelogin database. Enter the MySQL root password when it prompted.

Take MySQL tables dumps having a count greater than 200000. **you can find the following commands to backup the MySQL tables.**

```
root@jumpserver:~# mysqldump -u root -p $(grep -oP 'db_names+KS+' /usr/local/etc/ezlogin/ez.conf) $(grep -oP 'db_prefixs+KS+' /usr/local/etc/ezlogin/ez.conf) gwactivity_logs > $(grep -oP 'db_prefixs+KS+' /usr/local/etc/ezlogin/ez.conf) gwactivity_logs_28_12_2021.sql
```

```
root@jumpserver:~# mysqldump -u root -p $(grep -oP 'db_names+KS+' /usr/local/etc/ezlogin/ez.conf) $(grep -oP 'db_prefixs+KS+' /usr/local/etc/ezlogin/ez.conf) serveractivity_logs > $(grep -oP 'db_prefixs+KS+' /usr/local/etc/ezlogin/ez.conf) serveractivity_logs_28_12_2021.sql
```

```
root@jumpserver:~# mysqldump -u root -p $(grep -oP 'db_names+KS+' /usr/local/etc/ezlogin/ez.conf) $(grep -oP 'db_prefixs+KS+' /usr/local/etc/ezlogin/ez.conf) webactivity_logs > $(grep -oP 'db_prefixs+KS+' /usr/local/etc/ezlogin/ez.conf) webactivity_logs_28_12_2021.sql
```

```
root@jumpserver:~# mysqldump -u root -p $(grep -oP 'db_names+KS+' /usr/local/etc/ezlogin/ez.conf) $(grep -oP 'db_prefixs+KS+' /usr/local/etc/ezlogin/ez.conf) sshlogs > $(grep -oP 'db_prefixs+KS+' /usr/local/etc/ezlogin/ez.conf) sshlogs_28_12_2021.sql
```

Truncate the tables that have entries of more than 200000 after taking the table dump. **you can find dbprefix from /usr/local/etc/ezlogin/ez.conf config file.**

Run the command to find the dbprefix

```
grep -oP 'db_prefixs+KS+' /usr/local/etc/ezlogin/ez.conf
```

Replace the "dbprefix" before running the following commands.

```
root@jumpserver:~# mysql -u root -p -e "USE $(grep -oP 'db_names+KS+' /usr/local/etc/ezlogin/ez.conf); truncate table $(grep -oP 'db_prefixs+KS+' /usr/local/etc/ezlogin/ez.conf)gwactivity_logs;"  
  
root@jumpserver:~# mysql -u root -p -e "USE $(grep -oP 'db_names+KS+' /usr/local/etc/ezlogin/ez.conf); truncate table $(grep -oP 'db_prefixs+KS+' /usr/local/etc/ezlogin/ez.conf)serveractivity_logs;"  
  
root@jumpserver:~# mysql -u root -p -e "USE $(grep -oP 'db_names+KS+' /usr/local/etc/ezlogin/ez.conf); truncate table $(grep -oP 'db_prefixs+KS+' /usr/local/etc/ezlogin/ez.conf)webactivity_logs;"  
  
root@jumpserver:~# mysql -u root -p -e "USE $(grep -oP 'db_names+KS+' /usr/local/etc/ezlogin/ez.conf); truncate table $(grep -oP 'db_prefixs+KS+' /usr/local/etc/ezlogin/ez.conf)sshlogs;"
```

Now you can proceed with the Ezeelogin upgrade. Refer to the article to [upgrade Ezeelogin](#).

Follow the steps after upgrading ezeelogin

1. Replace the old db prefix with the new db prefix(dbprefix will be changed after the upgrade). You can view the new db prefix from **/usr/local/etc/ezlogin/ez.conf** after upgrade.

Take a copy of the MySQL tables dump

```
root@jumpserver:~# cp dbprefix_gwactivity_logs_28_12_2021.sql  
dbprefix_gwactivity_logs_copy.sql
```

```
root@jumpserver:~# cp dbprefix_serveractivity_logs_28_12_2021.sql  
dbprefix_serveractivity_logs_copy.sql
```

```
root@jumpserver:~# cp dbprefix_webactivity_logs_28_12_2021.sql  
dbprefix_webactivity_logs_copy.sql
```

```
root@jumpserver:~# cp dbprefix_sshlogs_28_12_2021.sql dbprefix_sshlogs_copy.sql
```

Replace the old db prefix with the new db prefix(dbprefix will be changed after the upgrade). You can view the new db prefix from /usr/local/etc/ezlogin/ez.conf after the upgrade.

For example : old_dbprefix : qwe_

new_dbprefix : wer_

```
root@jumpserver:~# sed -i 's/qwe_/wer_/g' dbprefix_gwactivity_logs_copy.sql
root@jumpserver:~# sed -i 's/qwe_ /wer_/g' dbprefix_serveractivity_logs_copy.sql
root@jumpserver:~# sed -i 's/qwe_ /wer_/g' dbprefix_webactivity_logs_copy.sql
root@jumpserver:~# sed -i 's/qwe_ /wer_/g' dbprefix_sshlogs_copy.sql
```

2. Back up the new Ezeelogin database after the upgrade. you can find the new database name from **/usr/local/etc/ezlogin/ez.conf** config file.

```
root@jumpserver:~# mysqldump -u root -ppassword  
ezlogin_serd > ezlogin_serd_28_12_2021.sql
```

3. Restore the old MySQL table dumps (replaced with new_dbprefix) to the new database. Refer to [the article to retrieve database credentials](#) after the upgrade

```
root@jumpserver:~# mysql -u ezlogin_pyy -p  
P4&[*V]Qx3jn3n7A6@p6p7]G    ezlogin_serd < dbprefix_gwactivity_logs  
_copy.sql
```

```
root@jumpserver:~# mysql -u ezlogin_pyy -p  
P4&[*V]Qx3jn3n7A6@p6p7]G    ezlogin_serd < dbprefix  
_serveractivity_logs _copy.sql
```

```
root@jumpserver:~# mysql -u ezlogin_pyy -p  
P4&[*V]Qx3jn3n7A6@p6p7]G    ezlogin_serd < dbprefix  
_webactivity_logs _copy.sql
```

```
root@jumpserver:~# mysql -u ezlogin_pyy -p  
P4&[*V]Qx3jn3n7A6@p6p7]G    ezlogin_serd < dbprefix _sshlogs  
_copy.sql
```

Login to MySQL and check the count of the restored logs table and verify

```
mysql > SELECT COUNT(*) FROM dbprefix_gwactivity_logs;  
mysql > SELECT COUNT(*) FROM dbprefix_serveractivity_logs;  
mysql > SELECT COUNT(*) FROM dbprefix_webactivity_logs;  
mysql > SELECT COUNT(*) FROM dbprefix_sshlogs;
```

Login to Ezeelogin GUI and verify the logs
