## How to force RDP to use TLS Encryption?

---

**Overview:** This article provides instructions on how to force Remote Desktop Protocol (RDP) to use TLS encryption.

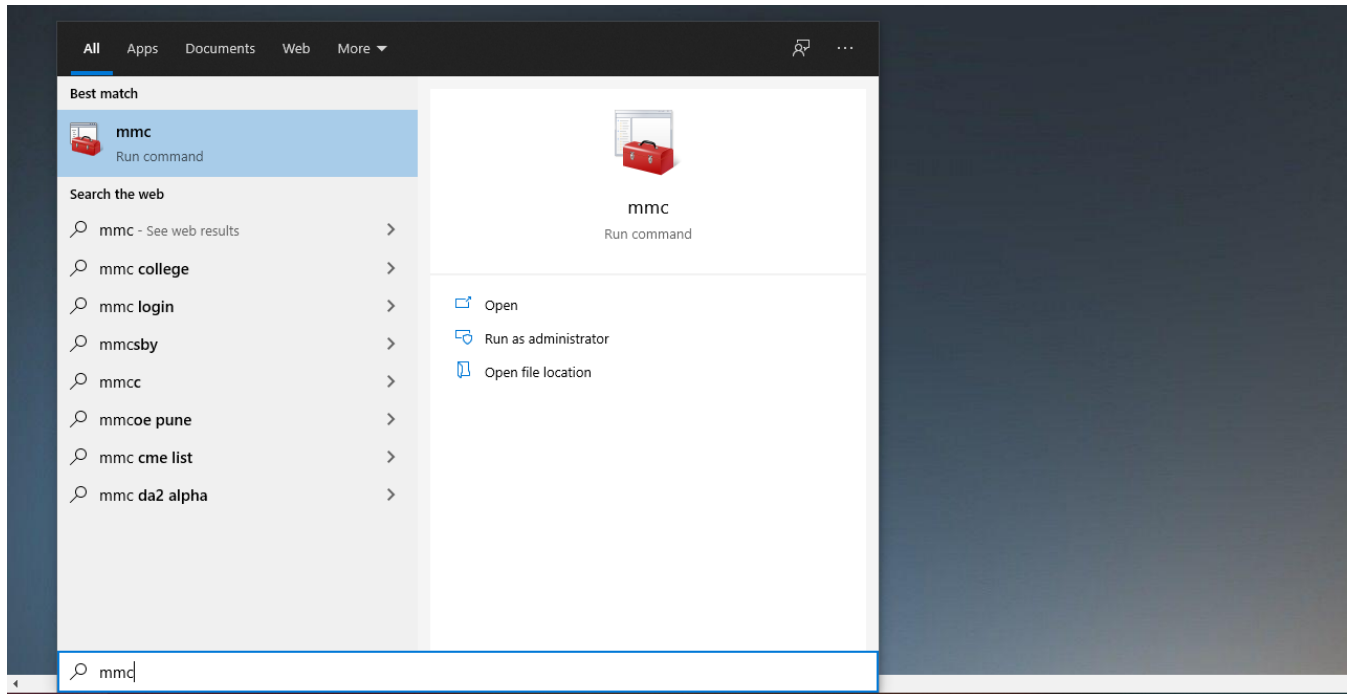

---

Windows Remote Desktop Protocol (RDP) is widely used by system administrators to provide remote operators access to internal systems and servers. In a shocking oversight, this connection does not use strong encryption by default. To force RDP to use TLS Encryption follow below steps

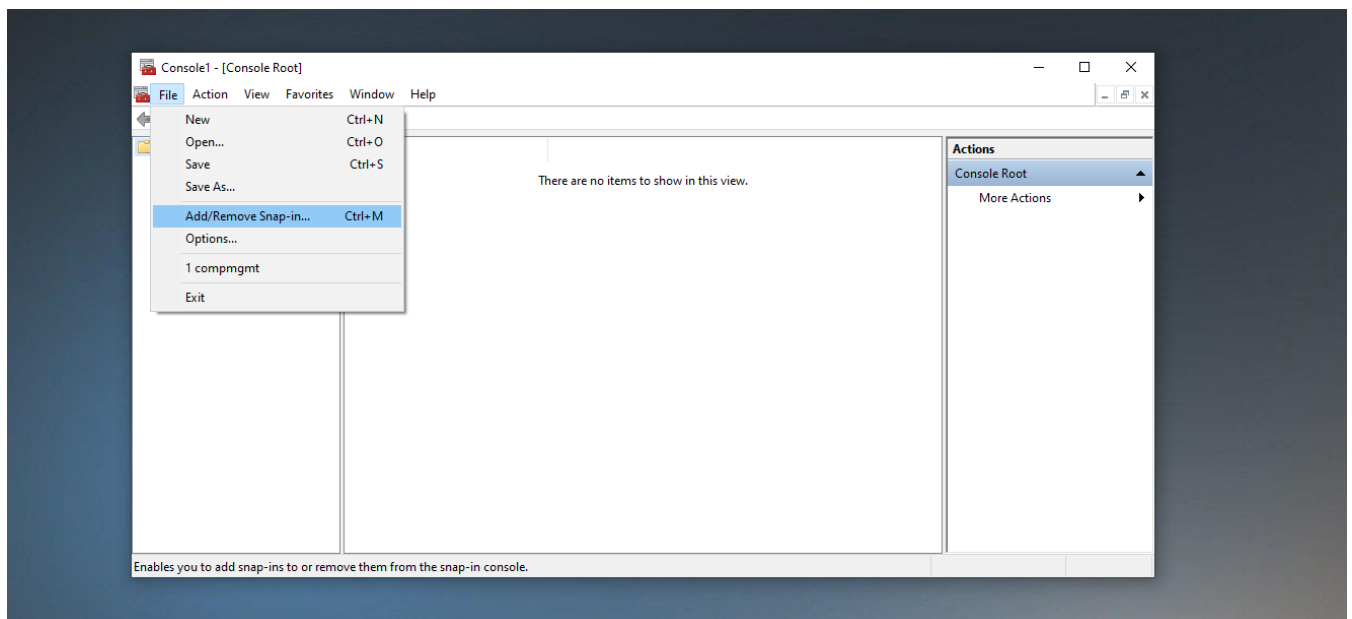

### Step 1: Open the Root console

Open the search bar and type "**mmc**" or run **mmc.exe** from the Run application. Select the top application, which will open the system console.

### Step 2: Open the Group Policy Editor Snap-in

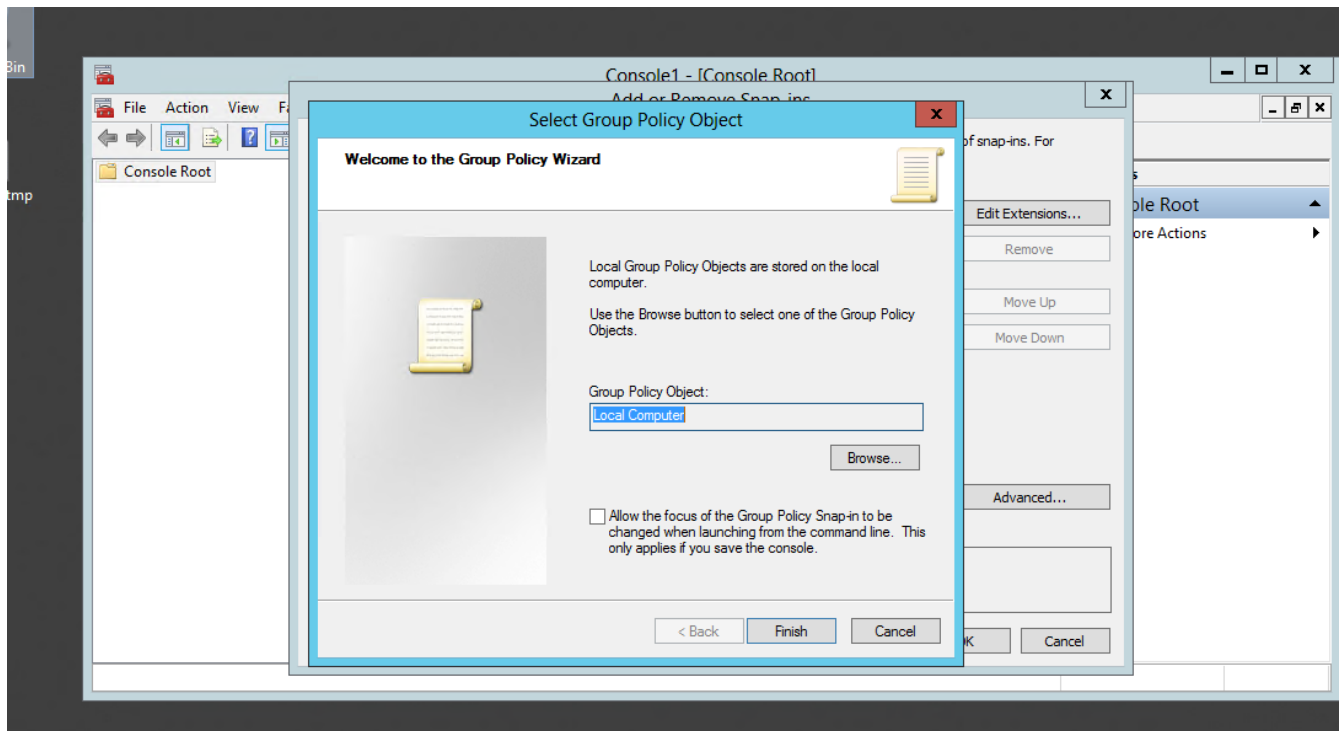

Open **File -> Add/Remove Snap-in** and select **Global Policy Editor**.

**Step 3: Select "Group Policy Editor" and click on "Add" the selected snap-in.**

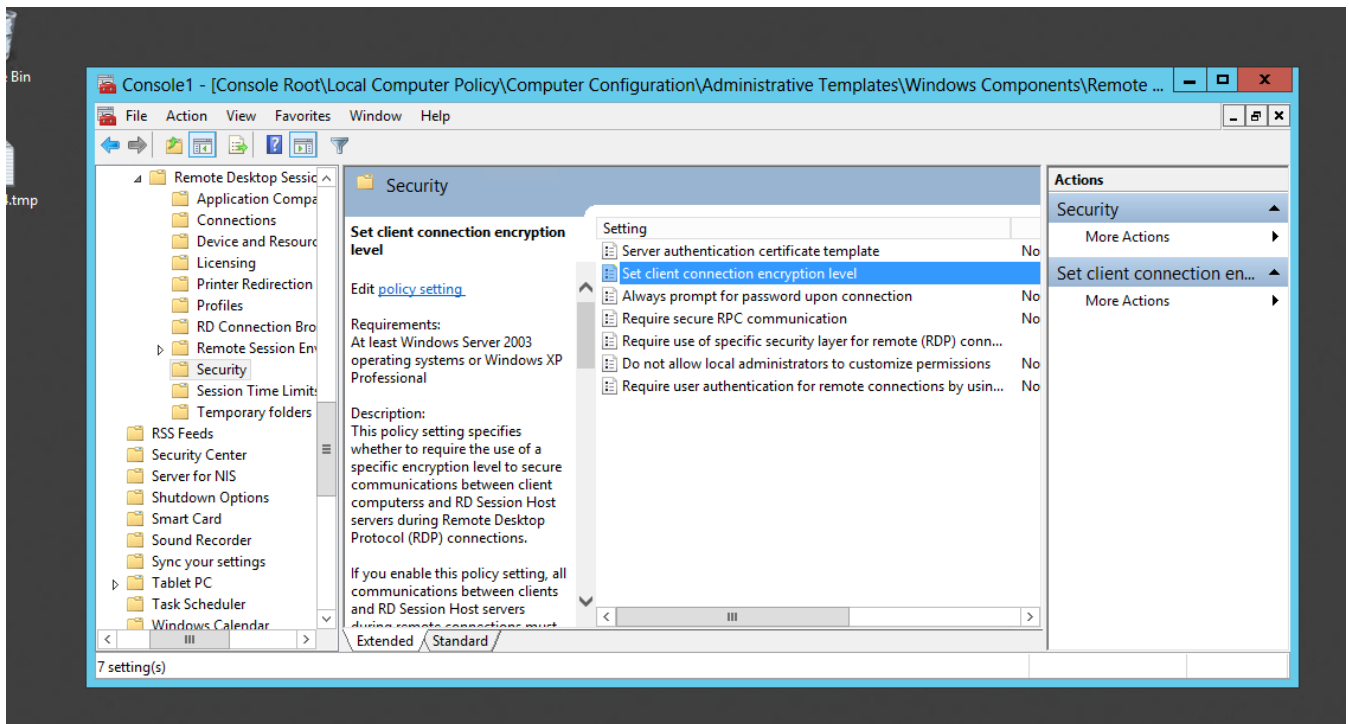

**Step 4:** Select the "Local Computer", this should be the default and select "Finish" > "Ok"

**Step 5:** Navigate to the RDP Session Security Policies

In the sidebar Navigate to **Local Computer Policy -> Computer Configuration -> Administrative Templates -> Windows Components -> Remote Desktop Services --> Remote Desktop Session Hosts -> Security**. Then select "Set client encryption level" and edit that policy.

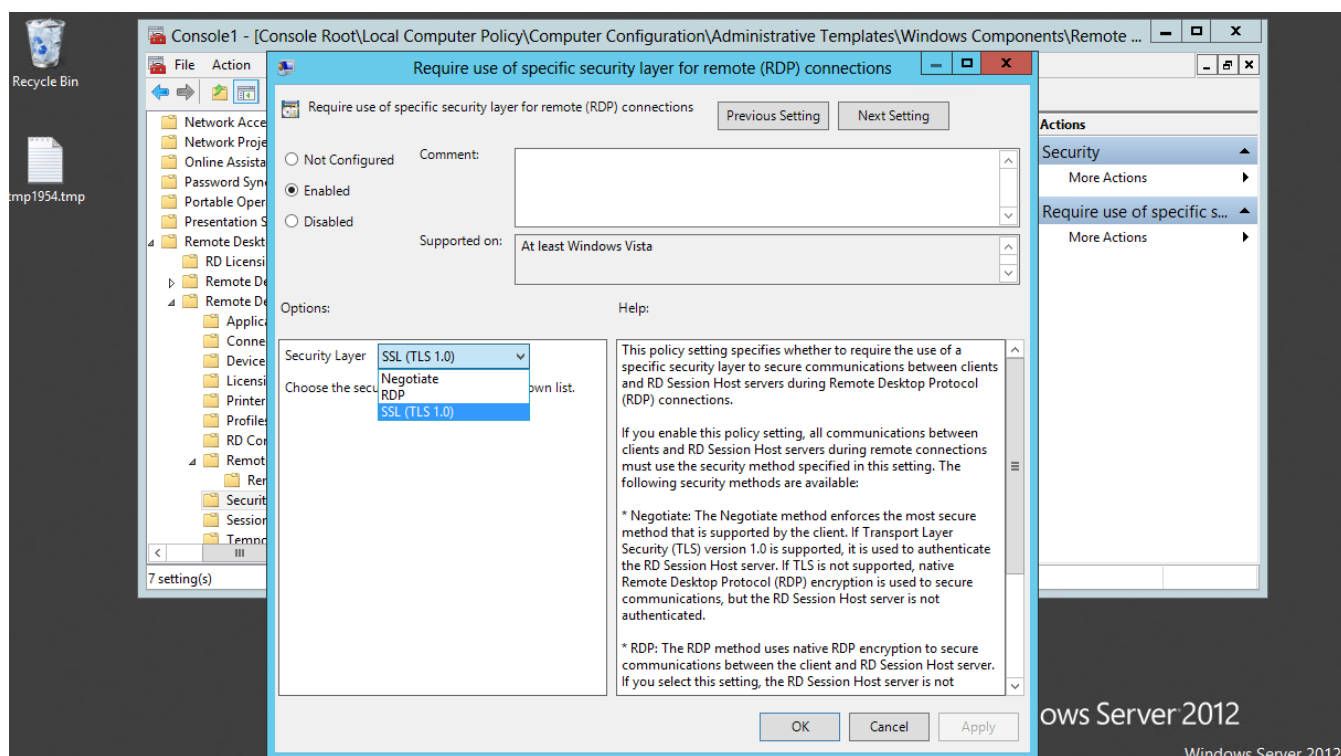

**Step 6:** Require the Highest native Encryption possible

Edit the "Set client encryption level policy".

**Step 7:** A better idea -> Force TLS instead

Edit the "Require use of specific security layer for remote (RDP) connections" policy.
