Does a password and security code need to be created for LDAP users for accessing the Ezsh shell?

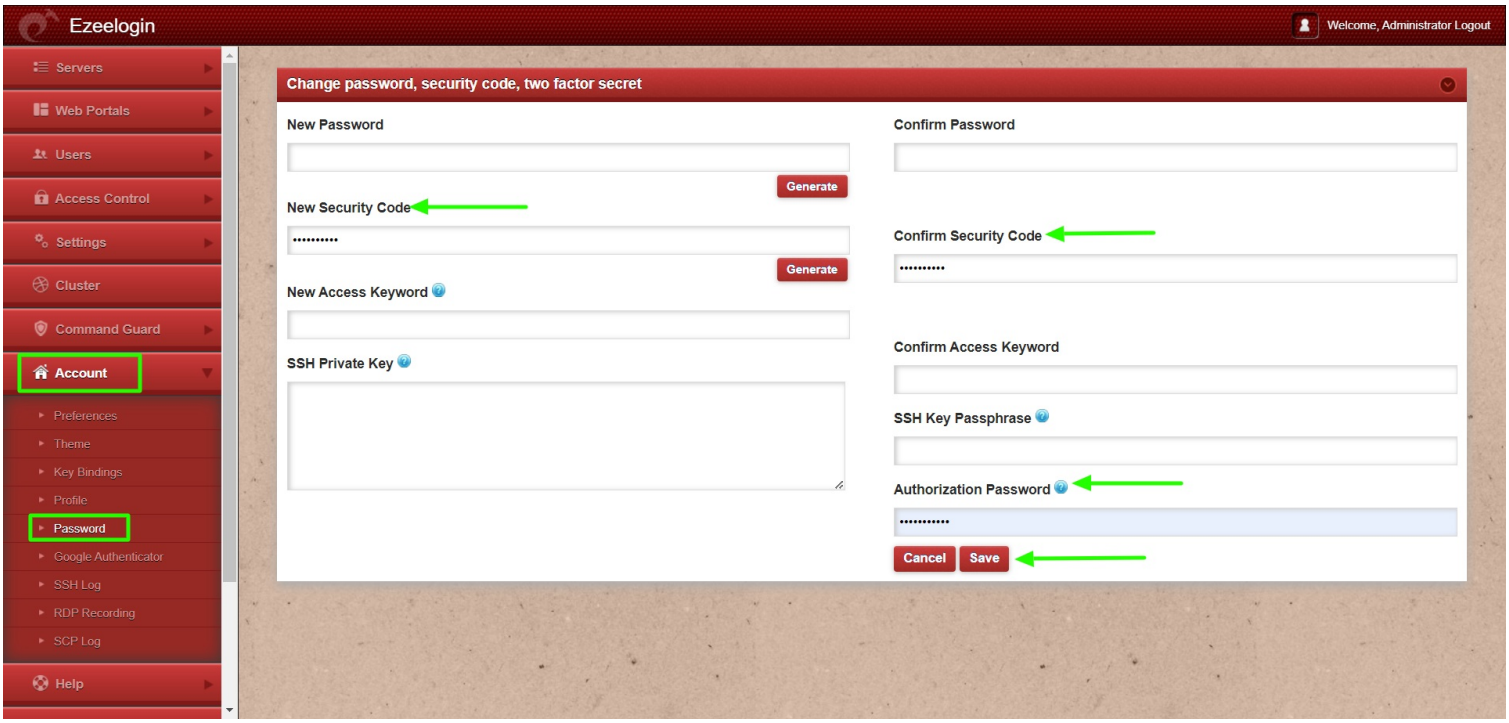

484 admin January 23, 2025 Security Features, Technical 4761

Do LDAP users require a new password and security code?

Overview: This article clarifies whether LDAP users need a new password and security code after being imported into Ezeelogin.

Passwords don't need to be created for LDAP users, but it is ideal to create a security code. You can also use the LDAP password as the security code, though it is recommended to keep them separate for better security.

Step 1: The security code can be created by navigating to **Account** -> **Password** -> **Security Code**. Provide the authorization password (**Authorization Password** is the password of the currently logged-in user) and click on **Save.**

Step 2: To use the LDAP password itself as the security code, navigate to **Settings** -> **General** -> **Authentication** -> **Security Code LDAP**. This setting can only be enabled by the admin privileged user.
