Do LDAP users require a new password and security code?

Overview: This article clarifies whether LDAP users need a new password and security code after being imported into Ezeelogin.

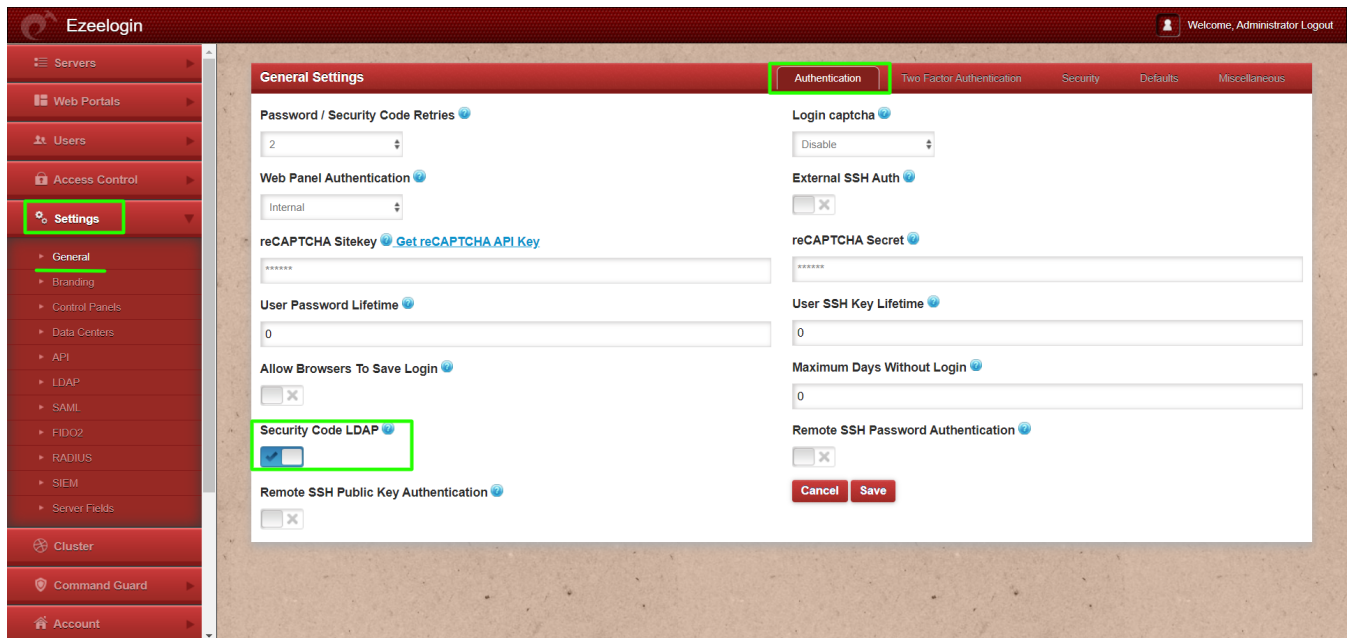

Passwords don't need to be created for LDAP users, but it is ideal to create a security code. You can also use the [LDAP password as the security code](#), though it is recommended to keep them separate for better security.

Step 1: The security code can be created by navigating to **Account -> Password -> Security Code**. Provide the authorization password (**Authorization Password** is the password of the currently logged-in user) and click on **Save**.

The screenshot shows the Ezeelogin web interface. On the left, a sidebar menu has 'Account' and 'Password' highlighted with green boxes. The main content area is titled 'Change password, security code, two factor secret'. It contains two columns of form fields. The left column has 'New Password', 'New Security Code', 'New Access Keyword', and 'SSH Private Key'. The right column has 'Confirm Password', 'Confirm Security Code', 'Confirm Access Keyword', 'SSH Key Passphrase', and 'Authorization Password'. Green arrows point to the 'New Security Code' field, the 'Confirm Security Code' field, the 'Authorization Password' field, and the 'Save' button at the bottom right. The 'Generate' buttons next to the 'New Password' and 'New Security Code' fields are also visible.

Step 2: To use the LDAP password itself as the security code, navigate to **Settings -> General ->**

Authentication -> Security Code LDAP. This setting can only be enabled by the admin privileged user.
