## Does a password and security code need to be created for LDAP users for accessing the Ezsh shell?

484 admin January 23, 2025 Security Features, Technical 2792

## Do LDAP users require a new password and security code?

**Overview:** This article clarifies whether LDAP users need a new password and security code after being imported into Ezeelogin.

Passwords don't need to be created for LDAP users, but it is ideal to create a security code. You can also use the <u>LDAP password as the security code</u>, though it is recommended to keep them separate for better security.

**Step 1:** The security code can be created by navigating to **Account -> Password -> Security Code**. Provide the authorization password (**Authorization Password** is the password of the currently logged-in user) and click on **Save.** 

Step 2: To use the LDAP password itself as the security code, navigate to Settings -> General ->

Authentication -> Security Code LDAP. This setting can only be enabled by the admin privileged user.
