

Enable remote startup script

648 Rakhi April 16, 2025 [Features & Functionalities](#) 1543

How to enable remote startup script in Ezeelogin?

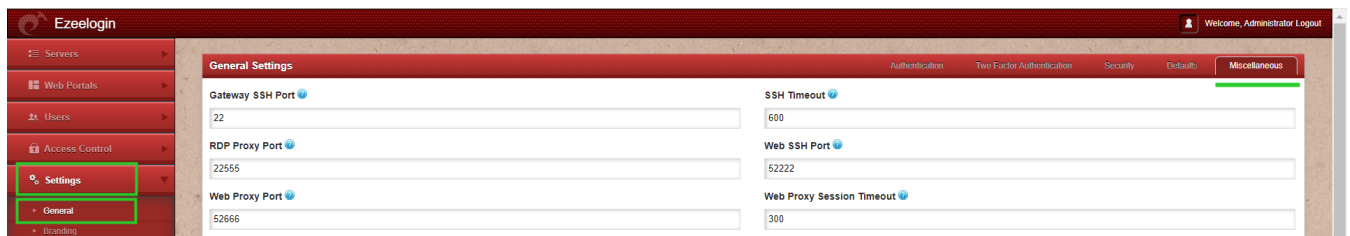

Overview: This article helps to enable remote startup script that allows users to define scripts and incorporate custom shells, commands, or functions that can be run on all remote machines.

This is a feature that allows users to define scripts and incorporate custom shells, commands, or functions that can be run on all remote machines. You have the flexibility to generate numerous commands, enabling them to execute on all remote machines as part of a startup script. **(It is a startup script to be sourced on all remote servers: Max size 8kb)**

This feature is available from [Ezeelogin version 7.36.0](#).

Step 1: Navigate to **Settings -> General -> Miscellaneous**.

Step 2: Enter the bash script within the **Remote Startup** section -> **Save** it.

The screenshot shows the Ezelogin web interface. The left sidebar contains a menu with options: Servers, Web Portals, Users, Access Control, Settings (highlighted), Cluster, Command Guard, Account, Help, and License. The 'Settings' page is displayed, with the 'General' tab selected. The 'Remote Startup Script' field is highlighted with a green box and contains the following text:

```
alias tcpconn='netstat -ln |grep tcp'
alias applogs='cd /var/www/ezlogin/application/logs'
```

Step 3: Verify the functionality of the alias by inspecting its operation when accessing a remote server through the gateway.

```
root@ubuntu22:~# tcpconn
tcp      0      0 0.0.0.0:22          0.0.0.0:*           LISTEN   721/sshd: /usr/sbin
tcp      0      0 127.0.0.53:53       0.0.0.0:*           LISTEN   623/systemd-resolve
tcp      0      0 127.0.0.1:3306      0.0.0.0:*           LISTEN   756/mariadb
tcp6     0      0 :::22              :::*                LISTEN   721/sshd: /usr/sbin
tcp6     0      0 :::80              :::*                LISTEN   762/apache2
tcp6     0      0 :::443             :::*                LISTEN   762/apache2
root@ubuntu22:~# applogs
root@ubuntu22:/var/www/ezlogin/application/logs# |
```
