

Include a single server in two distinct groups

669 Rakhi January 31, 2024 [Features & Functionalities](#) 231

How can you include a single server in two distinct groups

You can include the same server for 2 users using the following steps. Here you'll be creating 2 distinct user groups for 2 users or continuing with an existing one for instance. Next, generate a shared server group responsible for overseeing both users and grant both users permission to access this shared server.

Step 1. Create **two user groups** (Under Users tab > User Groups > Click on  icon) **for two distinct teams** for instance Developer and Tester.

(Refer: [How to create user group](#))

Step 2. Include those two users in the corresponding distinct user group

Step 3. Create a Common Super Group for two distinct teams.

(Refer to manual: [What is Super Group](#))

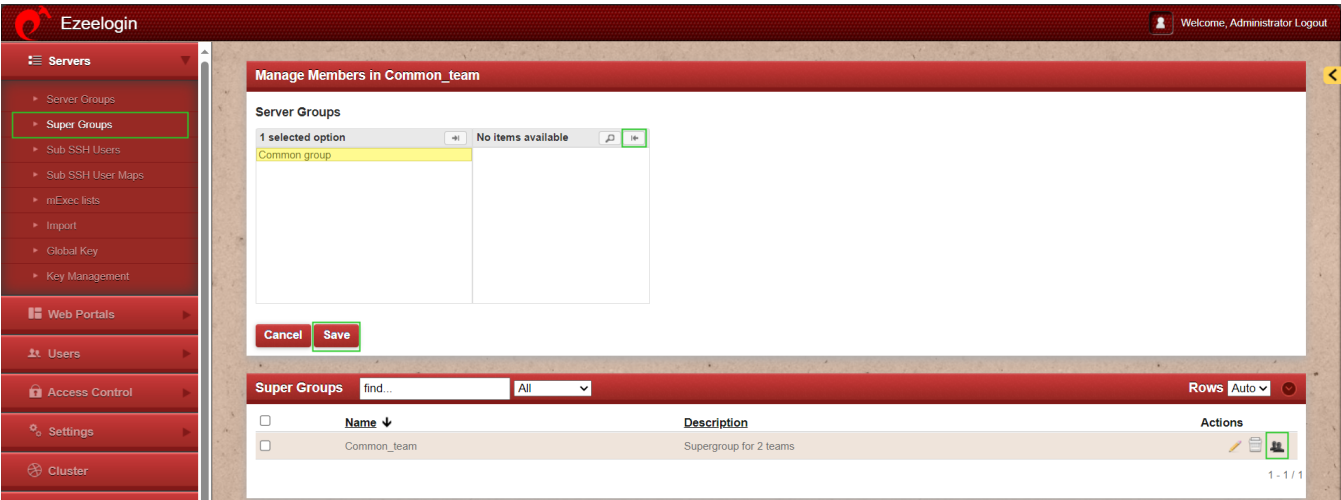

Step 4. Create a common server group or two distinct teams.

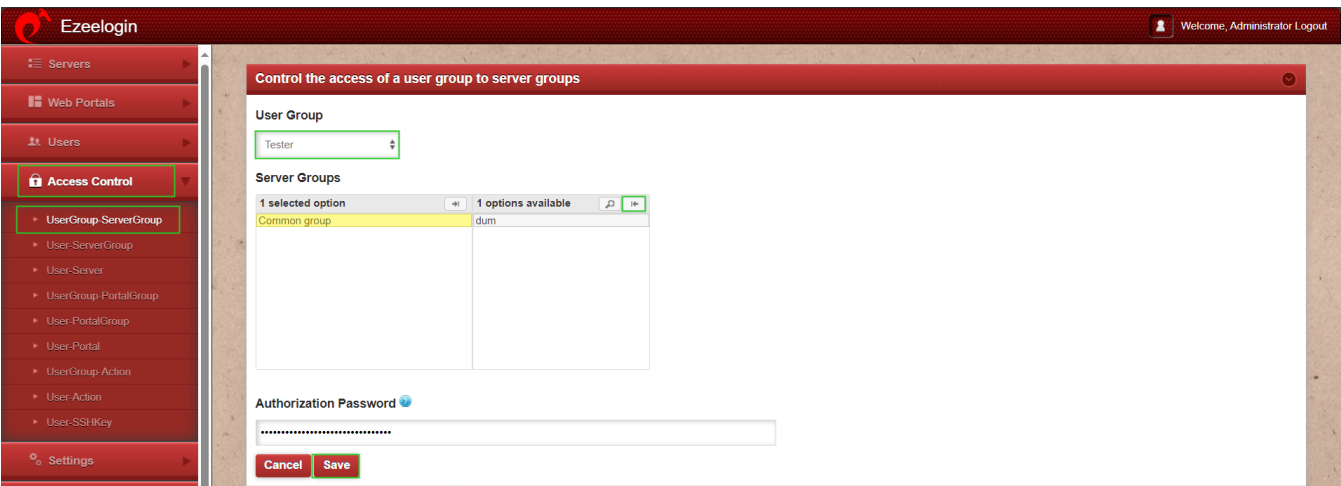

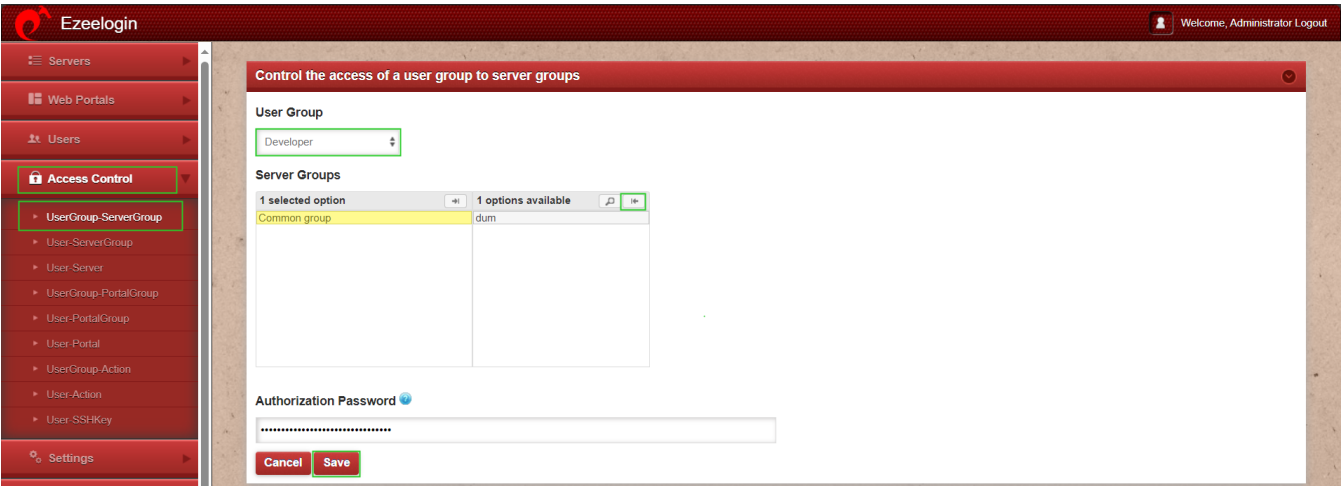

(Refer. [How to add a server group](#))

Step 5. Manage the supergroup members from the server group.

Step 6. Provide permission access to two user group members to server groups.

Step 7. Now, the corresponding users Evan & Mila can log in to the common server.
