

Cloudflare ZTNA for securing SSH access to endpoint devices

Setup Cloudflare ZTNA (Zero Trust Network Access) with Ezeelogin for securing SSH access

Cloudflare Tunnel can also route applications through a public hostname, allowing users to connect to an SSH server with Cloudflared access. This method requires Cloudflared to be installed on both the server and client machines, as well as an active zone on Cloudflare. The traffic is proxied over this connection.

The benefit of this method is that it provides a secure and reliable way to access Ezeelogin. By routing applications through a public hostname and using Cloudflare **Zero Trust Network Access**, you can enhance security by hiding your server's true IP address and exposing it through a secure Cloudflare Tunnel. This approach simplifies access, allowing users to connect to Ezeelogin from anywhere without the need for a VPN. Additionally, it improves reliability by leveraging Cloudflare's robust network, ensuring consistent and dependable access to your server. Centralized management of access and configurations is made easy through Cloudflare's dashboard, and the attack surface is reduced by minimizing the risk of direct attacks on your server using Cloudflare's security features.

1. Connect the server to Cloudflare

1. Login to [Cloudflare](#) dashboard. click on Zero Trust > Network > Tunnels

2. Click and **Create tunnel** and select **Cloudflared** connector, then click **next**

Select tunnel type / Name your tunnel / **Install and run connectors** / Route tunnel

Choose your environment

Choose an operating system:

WindowsMacDebianRed HatDocker

Choose an architecture:

64-bit32-bitarm64-bitarm32-bit

Install and run a connector

To connect your tunnel to Cloudflare, copy-paste one of the following commands into a terminal window. Remotely managed tunnels require that you [install cloudflared 2022.03.04 or later](#).

Store your token carefully. This command includes a sensitive token that allows the connector to run. Anyone with access to this token will be able to run the tunnel.

If you don't have cloudflared installed on your machine:

```
curl -L --output cloudflared.deb https://github.com/cloudflare/cloudflared/releases/latest/download/cloudflared-linux-amd64.deb &&
$ sudo dpkg -i cloudflared.deb &&
sudo cloudflared service install eyJhIjoizj...
```

If you already have cloudflared installed on your machine:

```
sudo cloudflared
$ service install
eyJhIjoizj...
```

5. After installation you can view the status as **connected** in the dashboard and click **next**

Overview **Public Hostname** Private Network

Public hostnames

[+ Add a public hostname](#)

Public hostname	Path	Service	Origin configurations	Menu
1 gateway.cloudweg.com	*	https://127.0.0.1	0	

Catch-all rule: **http_status:404** [Edit](#)

7. Append below lines in **/usr/local/etc/ezlogin/ez.conf**

```
root@gateway ~]# vim /usr/local/etc/ezlogin/ez.conf

host_url http://gateway.cloudweg.com
cookie_match_ip 0
```

If you have enabled **HTTPS** you should add **host_url https://your_domain_name**

Now you can access Ezeellogin GUI via **Cloudflare Zero Trust Network Access**

Access Ezeellogin GUI with the **subdomain** created <https://gateway.cloudflare.com>

Accessing Ezeelogin Shell via Cloudflare Zero Trust Network Access

1. Add a **Public Hostnames** from dashboard > configure > public hostname > Add a Public Hostnames

Cloudflare dashboard navigation sidebar:

- Zero Trust overview
- Analytics
- Gateway
- Access
- Networks
- Tunnels**
 - Routes
- My Team
- Logs
- Settings

Main content area:

Ezeelogin

Overview **Public Hostname** Private Network

Public hostnames

[+ Add a public hostname](#)

	Public hostname	Path	Service	Origin configurations	Menu
1	gateway.cloudweg.com	*	https://127.0.0.1	0	⋮
2	ezsh.cloudweg.com	*	ssh://127.0.0.1	0	⋮

Catch-all rule: **http_status:404** [Edit](#)

Choose a domain from the drop-down menu and specify any subdomain (for example,ezsh.cloudweg.com).

For Service, select **SSH**, enter **127.0.0.1** and click **save** hostname.

Cloudflare logo in the top left corner. The page title is "Public Hostname Page". The user is logged in as "Manuchacko@ezeel...". The left sidebar shows navigation options: Zero Trust overview, Analytics, Gateway, Access, Networks, Tunnels (selected), Routes, My Team, Logs, and Settings. The main content area is titled "Add public hostname for Ezeelogin". It contains the following fields: "Public hostname" (Subdomain: ezsh, Domain: cloudweg.com, Path: (optional) path). Below this is the "Service" section with "Type" (SSH) and "URL" (127.0.0.1) highlighted by a red box. A red arrow points from the top right to the "Save hostname" button. Another red arrow points from the top left to the Subdomain field. A third red arrow points from the top right to the Domain field. The "Save hostname" button is at the bottom right.

2. Connect as a Ezeelogin user from your Terminal via cloudflare Zero Trust Network Access

1. Install [Cloudflared](#) on the client machine.
2. Add the following to your SSH configuration file on your machine `~/.ssh/config`:

Input the following values; replacing **ezsh.cloudweg.com** with the hostname you created. Edit **vim** `~/.ssh/config`

```
Host ezsh.cloudweg.com

ProxyCommand /usr/local/bin/cloudflared access ssh --hostname %h
```

The cloudflared path may be different depending on your OS and package manager. For example, if you installed cloudflared on macOS with Homebrew, the path is `/opt/homebrew/bin/cloudflared`

3. You can now test the connection by running a command to access Ezeelogin shell via **zero trust network access(ZTNA)**. Replace **ezsh.cloudweg.com** with the hostname you created.

```
ssh <ezeelogin_username>@ezsh.cloudweg.com
```
