Overview: This article describes how to securely add multiple servers in Ezeelogin using custom SSH keys to enhance security and prevent unauthorized access.

To enhance security and avoid unauthorized access, always use a custom key pair for the server. This helps protect against unauthorized users who might try to re-add servers with a global public key.

Steps:

1. *Generate a custom SSH key pair for the server.*
2. *Add the server to Ezeelogin using the private key and passphrase.*
3. *Click Save to complete the addition of the server.*

Refer to the article: [How to Add a Linux Server Using Private Keys?](#)

The screenshot shows the 'Edit Server' interface in Ezeelogin. The left sidebar contains navigation links: Servers, Server Groups, Super Groups, Sub SSH Users, Sub SSH User Maps, mExec lists, Import, Global Key, Key Management, Web Portals, Users, Access Control, Settings, Cluster, Command Guard, Account, Help, and License. The main content area is titled 'Edit Server' and contains the following fields:

- Hostname: HorizonCloud
- IP Address(es): 192.168.0.112
- Remote SSH / RDP Login User: root
- SSH Private Key: A long, multi-line private key string is entered in the text area.
- SSH Key Passphrase: A password field is present.
- SSH Port: 22
- Password Management: keep server password
- RDP Port: 3389
- Windows Domain: (empty)
- Control Panel: -- None --
- Description: (empty)
- SSH: enabled
- Server Group: CollectiveTech
- RDP: (disabled)
- Datacenter: -- None --
- First Prompt: (empty)

At the bottom right, there are 'Cancel' and 'Save' buttons. The 'Save' button is highlighted with a green box.

Method 2: Manage SSH Keys Using Key Management

You can also manage SSH keys effectively by storing and using them through Ezeelogin's SSH key management feature.

Steps:

1. Navigate to the SSH [Key Management](#) section.
2. *Add your custom key to the SSH key management.*
3. *Save the private keys in this section for future use.*

Refer to the screenshots below for guidance on adding private keys to the key management:

Access Control to Specific Users.

To grant specific user access to keys from key management, the admin must navigate to the User SSHKey under the Access Control section. Select the keys required for the user, such as "tom," and click Save to apply the changes.

Avoid Using Global Public Keys

To prevent security risks, make sure not to use a [global public key](#) when adding a server. Always rely on custom key pairs for each server to ensure that access is securely managed and controlled.

By following these steps, you can securely add servers in Ezeelogin and manage them effectively using custom keys and key management features.
