LDAP Filters for Active Directory Users

789 Ashin October 1, 2025 Features & Functionalities 1801

How to add LDAP Filters for Active Directory Users in Ezeelogin

Overview: This article explains how to use LDAP filters in Ezeelogin to manage users based on their group memberships in Active Directory (AD). The examples are built using AD structure with the **groups windows AD** and **Developers AD.**

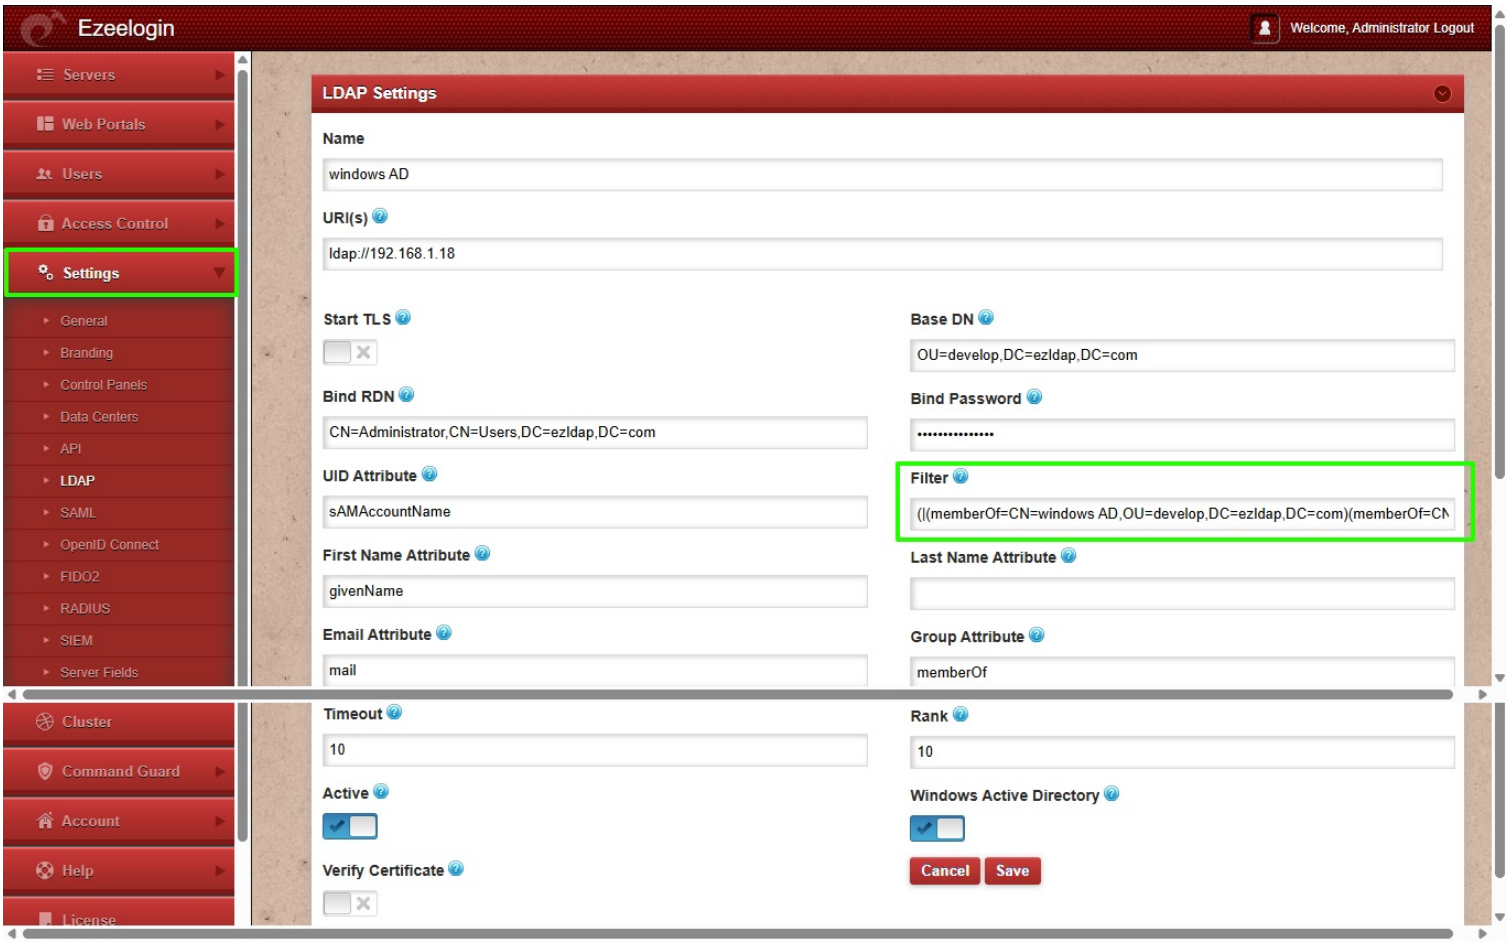
Example Environment details:

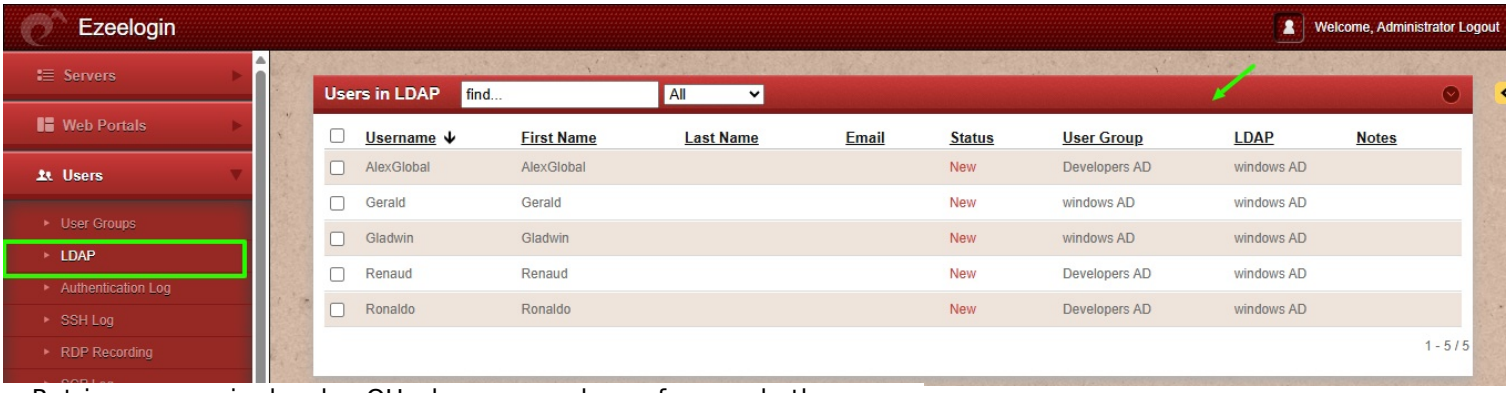
Base DN: OU=develop,DC=ezldap,DC=com
All users are stored inside this Organizational Unit (OU).
Groups in this OU:

1.windows AD
DN: CN=windows AD,OU=develop,DC=ezldap,DC=com
Example member: CN=Joy,OU=develop,DC=ezldap,DC=com
2.Developers AD
DN: CN=Developers AD,OU=develop,DC=ezldap,DC=com
Understanding LDAP Filters: LDAP filters are queries that find users or other directory entries based on their attributes —like group membership.

Operators:
& (AND): Matches if all conditions are true
| (OR): Matches if at least one condition is true
! (NOT): Matches if the condition is false

Example 1: Find users in OU=develop who are in either "windows AD" OR "Developers AD"
Explanation: Finds users who belong to at least one of these two groups.
Use case:
All users who have access to a particular service or resource can be listed as follows.
LDAP Filter:
(|(memberOf=CN=windows AD,OU=develop,DC=ezldap,DC=com)(memberOf=CN=Developers AD,OU=develop,DC=ezldap,DC=com))



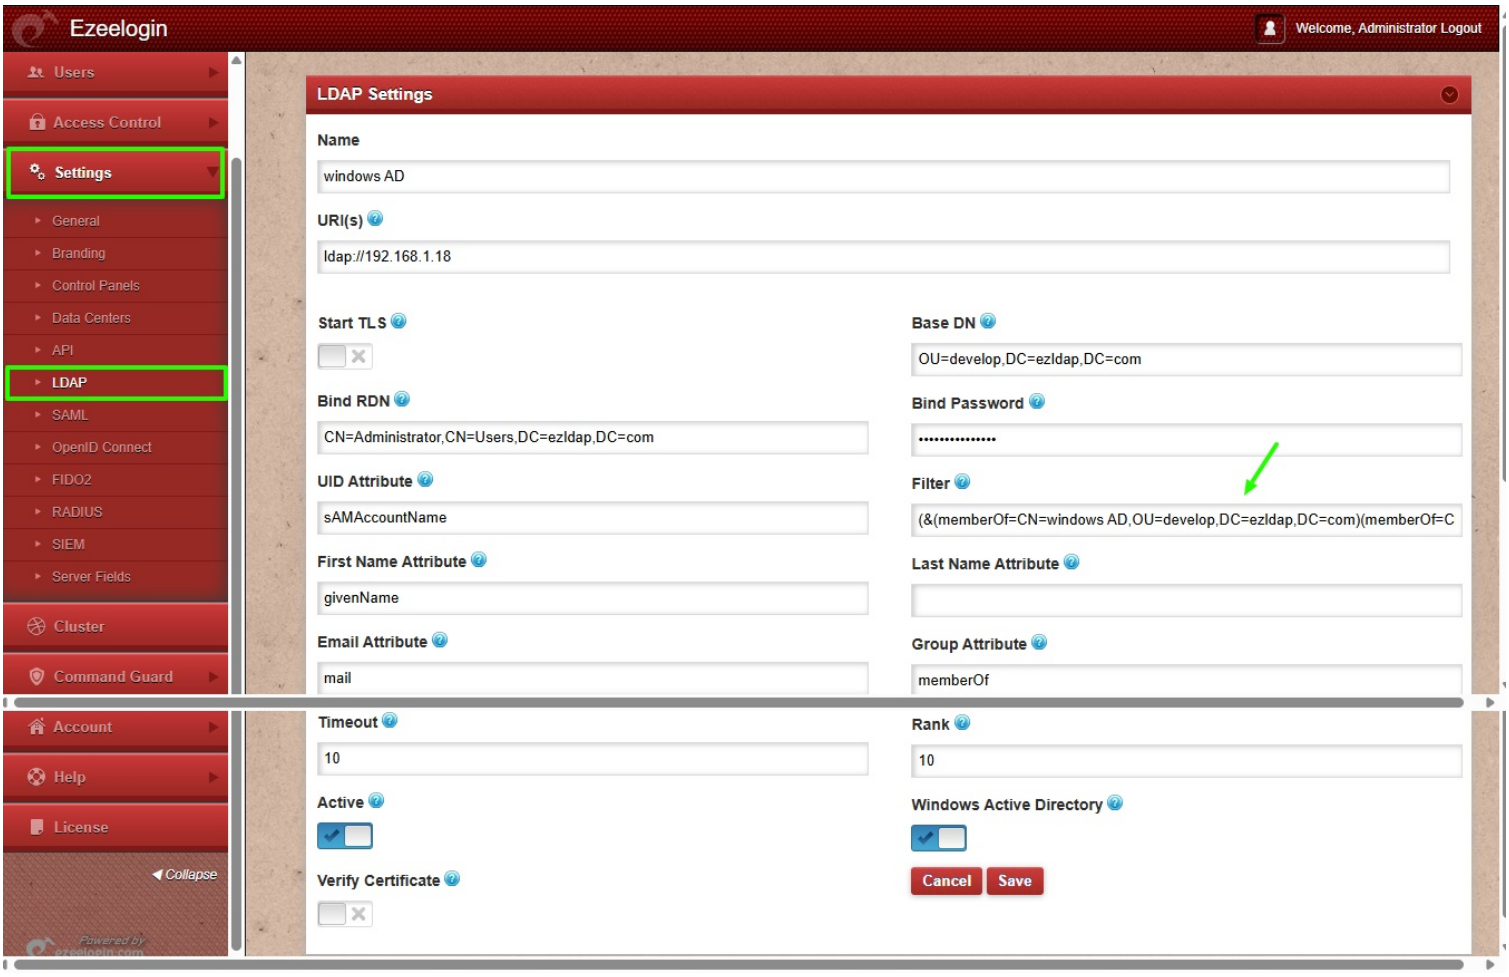


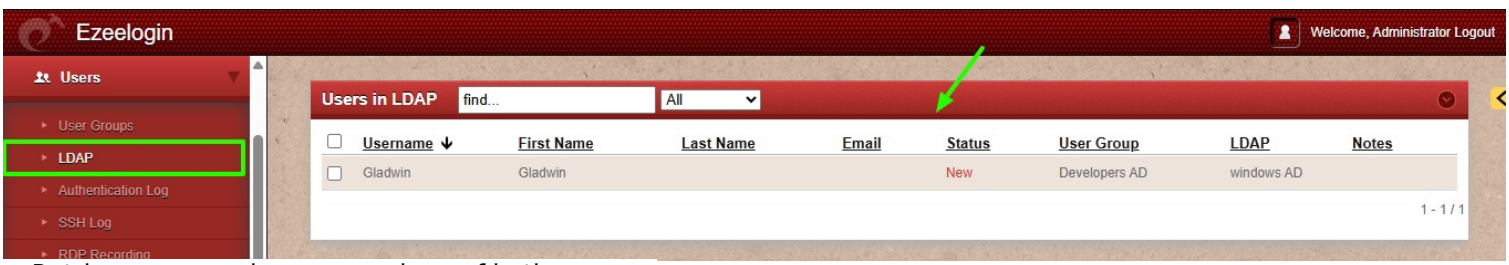
➡ Retrieves users in develop OU who are members of one or both groups.

Example 2: Find users in OU=develop who are in BOTH "windows AD" AND "Developers AD"
LDAP Filter:
(&(memberOf=CN=windows AD,OU=develop,DC=ezldap,DC=com)
(memberOf=CN=Developers AD,OU=develop,DC=ezldap,DC=com))

Explanation:
Finds users who are members of both groups at the same time.

Use case:
In cases where users require permissions in both systems.





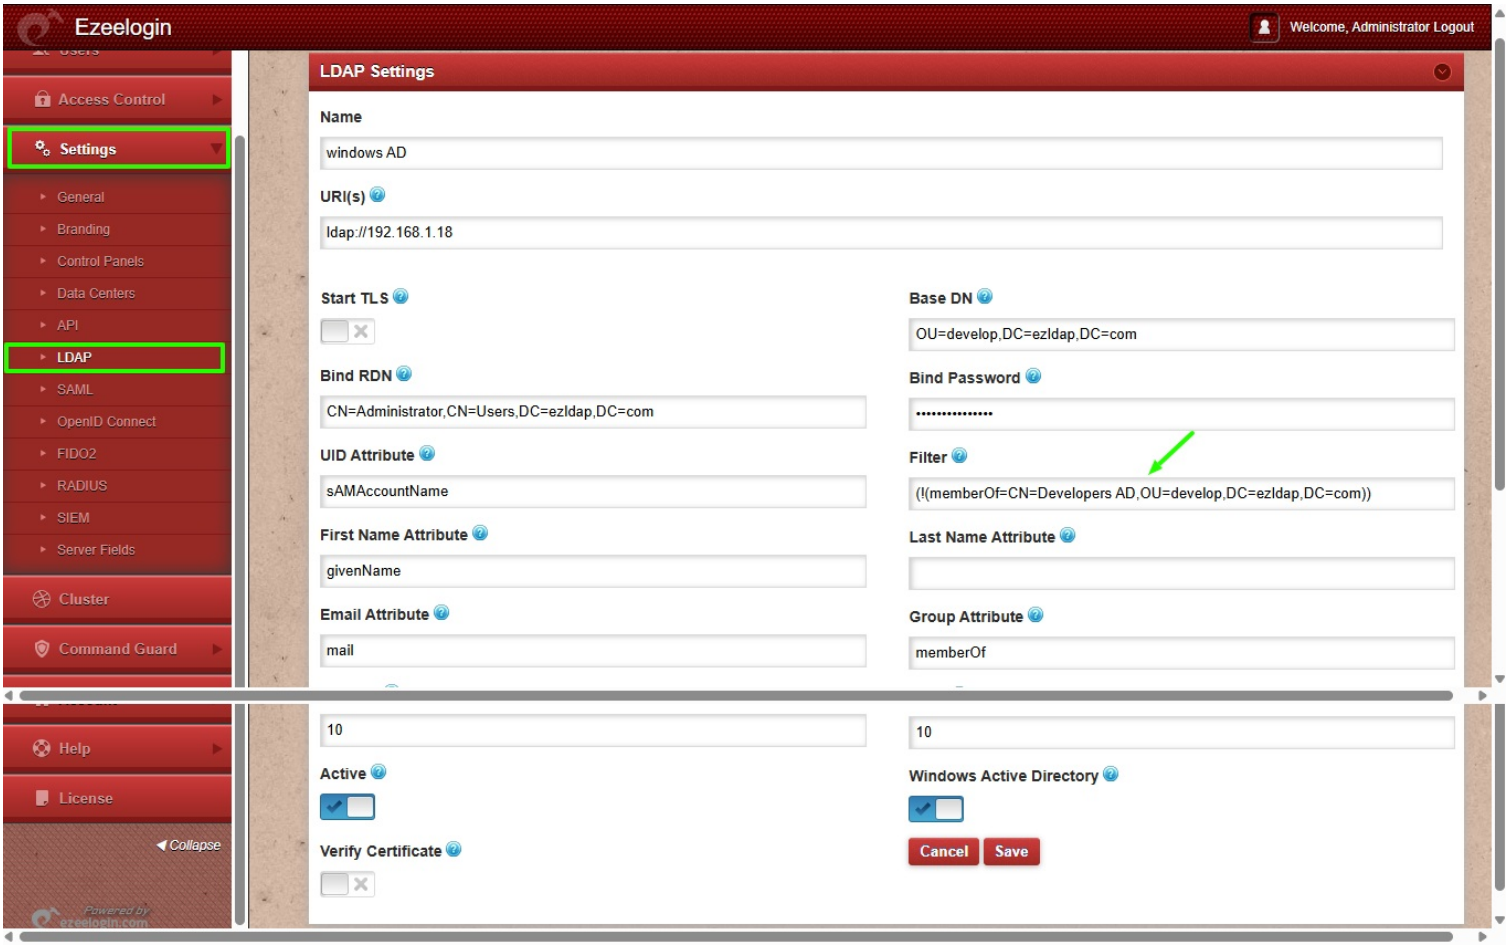
➡ Retrieves users who are members of both groups.

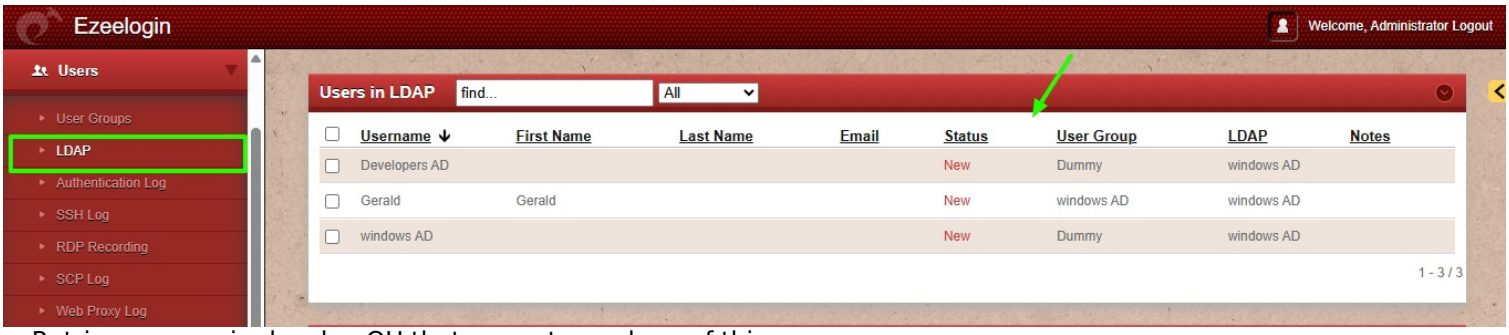
Example 3: Find users in OU=develop who are NOT in "Developers AD"

LDAP Filter:
(!(memberOf=CN=Developers AD,OU=develop,DC=ezldap,DC=com))

Explanation:
Finds users who are in 'develop' but not part of 'Developers AD'.

Use case: If you want to exclude certain users from access or permissions.





➡ Retrieves users in develop OU that are not members of this group.

Example 4: Find users in OU=develop who are in "windows AD" but NOT in "Developers AD"
LDAP Filter:

(&(memberOf=CN=windows AD,OU=develop,DC=ezldap,DC=com)(!(memberOf=CN=Developers AD,OU=develop,DC=ezldap,DC=com)))

Explanation:
Finds users who are in 'windows AD' but not part of 'Developers AD'.

Use case:
Access can be restricted to members of one group while explicitly excluding those who are also part of another group.

➡ Retrieves users in develop OU who are members of the first group and not in the second.

Applying the filters in Ezeelogin:

1. Go to Users → LDAP in the Ezeelogin admin interface.
2. Set Base DN as: OU=develop,DC=ezldap,DC=com
3. Paste one of the filters in the LDAP Filter section.
4. Save and click Test Connection.
5. Check Users in LDAP to see the result.
6. Import users as needed.

Key takeaways:

✔ Filter users based on group membership using &, |, and !.

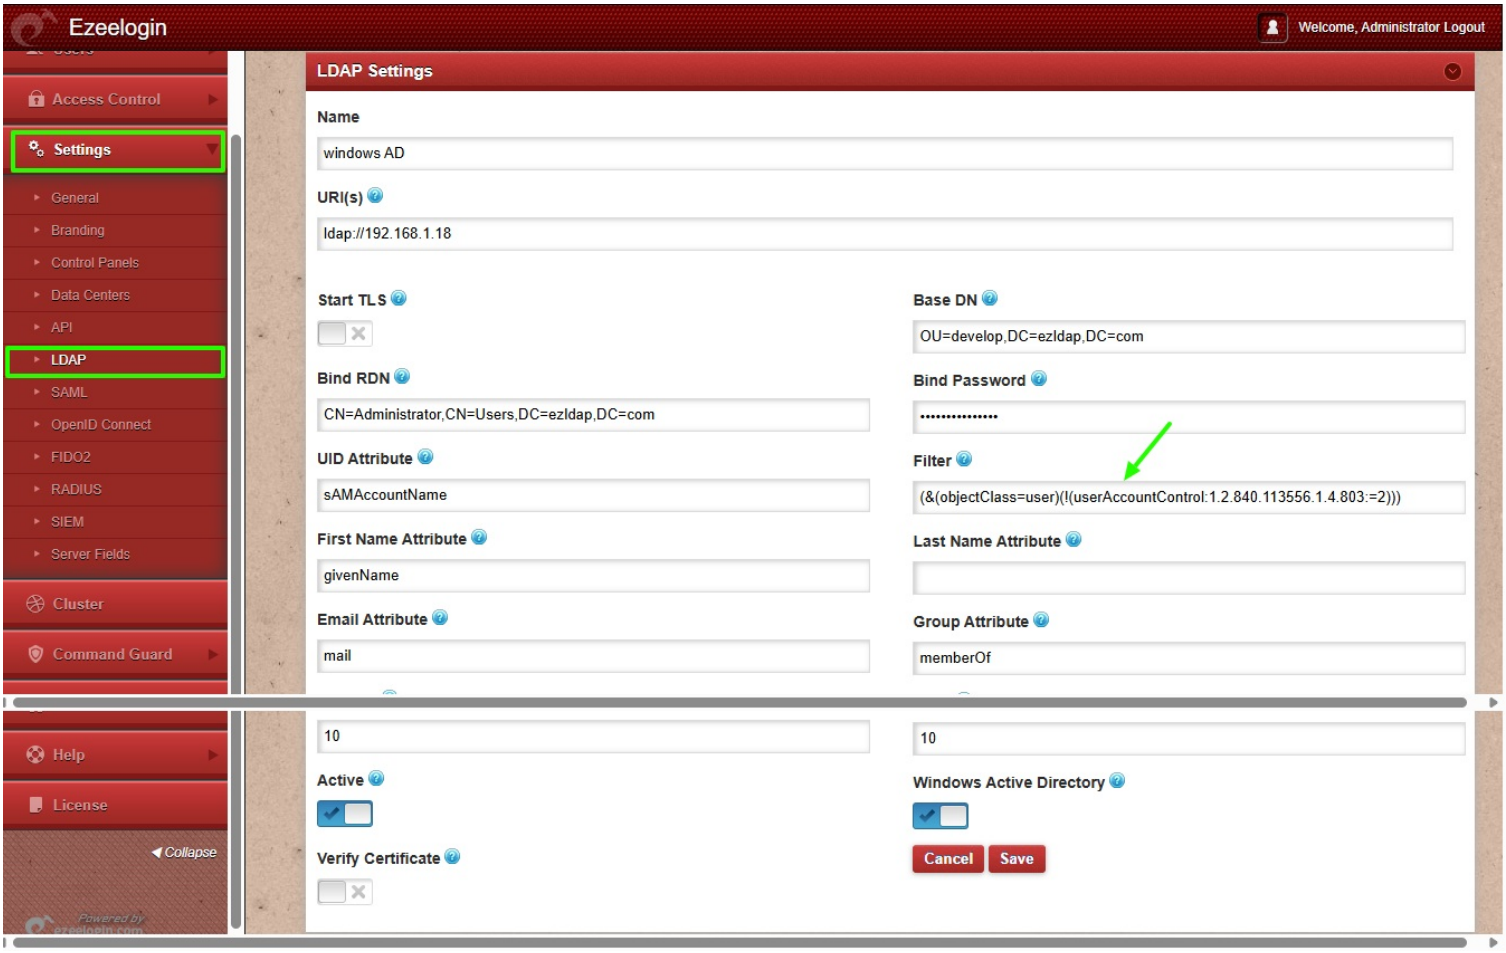
✔ Use the full DN of the group inside memberOf.

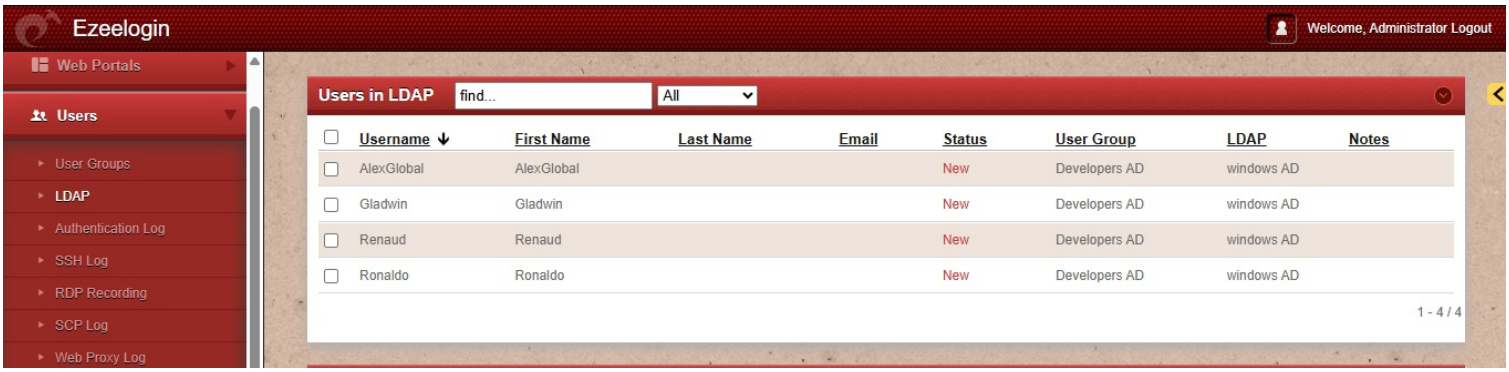
✔ Filters can be combined for complex queries.

✔ Ezeelogin allows to view and manage users based on these LDAP filters in real-time.

List Enabled User Accounts (LDAP filter for enabled accounts):

(&(objectClass=user)(!(userAccountControl:1.2.840.113556.1.4.803:=2)))





List Disabled accounts only:

Disabled accounts in AD have the **userAccountControl flag 514**.

(&(objectClass=user)(userAccountControl:1.2.840.113556.1.4.803:=514))

LDAP Search Command to List All Above Conditions of Filters

Example 1 — Users in "windows AD" OR "Developers AD"

```
root@gateway:~# ldapsearch -x -H ldap://192.168.1.18 -D "CN=Administrator,CN=Users,DC=ezldap,DC=com" -W -b "OU=develop,DC=ezldap,DC=com" "(|(memberOf=CN=windows AD,OU=develop,DC=ezldap,DC=com)(memberOf=CN=Developers AD,OU=develop,DC=ezldap,DC=com))"
```

The output of the above ldapsearch command is shown below.

```
Enter LDAP Password:
# extended LDIF
#
# LDAPv3
# base <OU=develop,DC=ezldap,DC=com> with scope subtree
# filter: (|(memberOf=CN=windows AD,OU=develop,DC=ezldap,DC=com)(memberOf=CN=Developers AD,OU=develop,DC=ezldap,DC=com))
# requesting: ALL
#

# AlexGlobal, develop, ezldap.com
dn: CN=AlexGlobal,OU=develop,DC=ezldap,DC=com
objectClass: top
