

Error while taking ezlogin backup

How to Fix Ezeelogin Backup Errors Caused by Large Log File Sizes

Overview: This article explains how to resolve an error that may occur while taking an Ezeelogin backup, which is caused by a large log file size.

While performing a backup, the Ezeelogin [backup script](#) may encounter an error:

```
#####
#  Ezeelogin Backup      #
#####

Checking environment...  The memory limit is less than 4 GB. If the script crashes abruptly without any errors, try increasing the PHP memory limit.
done

Based on your command line arguments, you may be prompted to enter the missing settings. The default value will be given in bold. Simply pressing enter key will choose the default value.
Creating directories... done
Copying files... done
Backup database... done
Backup logs... done
Creating executable archive...
Could not create backup archive: Header is 718 lines long

About to compress 2154932 KB of data...
Adding files to archive named "/var/ezlogin_backup_v7.43.2_b381_p8.2.29_Wed_Sep_24_2025_00_11_33_UTC.bin"...

```

During the backup process, if the error "**Could not create backup archive**" occurs, it indicates that the Ezeelogin log files have grown significantly in size. An error similar to the one shown in the screenshot may appear while running the [backup script](#) `/usr/local/sbin/backup_ezlogin.php`. The **trace** setting generates detailed debugging information, which significantly increases the size of the log files over time. As a result, the backup script may fail or produce errors while attempting to include these large log files in the backup archive.

Steps to fix the issue:

Step 1. Check the size of the logs inside the directory

```
root@gateway: du -sh /var/www/ezlogin/application/logs
```

Example: root@gateway:/var/www/ezlogin/application# du -sh /var/www/ezlogin/application/logs

```
8.1G /var/www/ezlogin/application/logs
```

Step 2. Delete the unnecessary logs file to free up space.

```
root@gateway: rm -f /var/www/ezlogin/application/logs/*
```

Example:

```
root@gateway:/var/www/ezlogin/application/logs# ls
```

```
index.html log-2025-09-11.php log-2025-09-12.php log-2025-09-13.php log-2025-09-15.php log-2024-09-11.php log-2024-09-12.php log-2024-09-13.php log-2024-09-15.php log-2024-09-14.php
```

```
root@gateway:/var/www/ezlogin/application/logs#
```

```
root@gateway:/var/www/ezlogin/application/logs# rm -f log-2024*
```

Step 3: Comment the **log_level trace** entry in the Ezeelogin configuration file **/usr/local/etc/ezlogin/ez.conf**.

```
root@gateway:~# vi /usr/local/etc/ezlogin/ez.conf
```

```
cver 2
```

```
system_folder /var/www/ezlogin/
```

```
www_folder /var/www/html/ezlogin/
```

```
uri_path /ezlogin/
```

```
force_https no
```

```
db_host localhost
```

```
db_port /var/run/mysqld/mysqld.sock
```

```
db_name ezlogin_phbhw
```

```
db_user ezlogin_yxfho
```

```
db_pass
```

```
et9Nq7wJ23AQJDEV/WVWHQVrsfnkuXY2b6dJOa8G6Mae4Cfj56cKMf0MnXoc6aRq3WOzMQwj3Ecob/pvrc95VC1gc=
```

```
db_prefix jozkic_
```

```
cookie_encryption_key
```

```
EpPNRGxfrVxhInO4MYBZru1FyLZD4vS48j/Q4eXuNWKz6wd99hZZ5inWMiYLUz6x0cLke75oFM=
```

```
cookie_name xikmk
```

```
cookie_path /ezlogin/
```

```
admin_user admin
```

```
mysql_encrypt no
```

```
noproxy 1
```

```
#log_level trace
```

Step 4. Run the backup command again.

```
root@gateway:/usr/local/sbin/backup_ezlogin.php
```

Deleting the logs in **/var/www/ezlogin/application/logs** does not affect SSH or web activity logs. It only removes debug logs created for troubleshooting. The **log_level trace** option should be used only while troubleshooting Ezeelogin issues.
