key_read: uudecode ssh user cant login with ssh key

User can't log in with their SSH key and I'm getting this error in /var/log/secure

synopsis: This article explains how to resolve SSH login issues by updating a user's public key, either through the Ezeelogin backend or by manually editing the authorized_keys file on the gateway server.

Make sure that your public key is not corrupted. Try generating a new public key and paste it in the backend.

Refer the following article to update the ssh gateway users public key.

[SSH authentication key](#)

Alternatively, you can update the public key by sshing into the gateway server and paste the public key in **/home/user/.ssh/authorized_keys**
